INTRODUCTION

Information and Communication Technology (ICT), also known as Information Technology (IT), is the driving force in technological development. Its role in boosting economies of nations, industrial productivity, socio-cultural integration, development of professions, education and research, medicine, politics, communication, private households, and entertainment etc., has been enormous and popularized. There is therefore the need, to guide the Cameroonian youth into developing competencies in this domain thereby providing solutions to real life challenges. Such competencies developed at this level, are to build a solid framework for students who will continue with this domain of study, or other related disciplines, at the University level, those who will start their professional activities after High School, and those who just require digital literacy for solving their commonly encountered personal problems.

This syllabus is designed to mould candidates into acquiring or developing a range of IT skills in the context of a sound understanding of the technical foundation of current computer systems and to promote the knowledge and use of a wide range of current computer applications, particularly from the point of view of their design and implementation. It highlights issues related to societal implications of the use of ICTs. It extends to the design of simple software and basic digital circuits, thus equipping the learner with preliminary skills in computer technology and Computer Science. The emphasis is on fundamental principles that underlie ICTs rather than on the current state of the art, so that the knowledge acquired remains relevant even after significant technological evolution. A well-trained ICT student is expected to be able to make informed decisions on when and where to use ICT, and should also be aware of the implications of the use of ICTs in the home, at the job site, and in society at large.

Furthermore, even though this syllabus is oriented towards standard syllabuses used for computing and information technology at the advanced or equivalent levels and comparable to similar curricula across the world, it focuses more on development of competencies rather than just acquisition of knowledge.

In this context, the **Competency Based Approach** method of teaching/learning which favors learner centered teaching/learning has been adopted with an entry and/or exit through real life situations. Two main approaches have been used:

- A. ***The Problem Based Learning Approach***, in which the student /learner are presented with ill-structured real life problems and they play the role of active problem solvers, while the teacher assumes the role of a coach.
- B. ***The Project Approach*** which is constructivist pedagogy. This involves the presentation of a real life situation in the form of a mini project; thereby provoking inquiry based learning and computational thinking, in which large problems are broken down into small tasks. These help foster students' life- long learning.

SECOND CYCLE LEARNER PROFILE

The learner profile of the second cycle of secondary school is summarized in the following components:

1. Demonstrate understanding and choice of career paths that lead to IT and computer-focused employment including computer management, programming, IT services, and systems development.
2. Exhibit proof of a thoroughly trained citizenry and a better equipped workforce for an information society or an emergent knowledge society.
3. Acquire and show essential preparedness for, or exemptions from requirements in, higher-level studies in ICT and related disciplines; and
4. Understand and apply pre-requisite knowledge for, and exemptions from, computing-related requirements in vocational and tertiary educational programmes.

AIMS OF THE SYLLABUS

The aims of this syllabus are:

1. To enhance development of skills and provide a foundation for advanced competencies in the following:
 - a. Information processing.
 - b. Information and Communications Technology.
 - c. Computer programming.
2. To explore the impact of computers on people both as individuals in society and as integral parts of an organization and make contributions towards positive impact.

MODULES AND EXPECTED COMPETENCIES

The ICT syllabus is split up into 5 modules, which are carefully structured to take the learner from the introduction of the system through to the practical applications or using of it. The methodology for bringing this through is crafted with the proposal of mini projects at the end of most real life situations. The projects enable the learner to demonstrate competency after the acquisition and use of required skills for such competency. The modules are as follows:

| CLASS | MODULES |
|-------------|---|
| LOWER SIXTH | Module I: Computing Environment and Components |
| | Module II: Impacting society with digital technology |
| | Module III: Building ICT systems |
| UPPER SIXTH | Module IV: Communication and resource sharing in IT |
| | Module V: Practical problem solving in the digital world |

Reasons for the structuring into five modules

The successful acquisition and use of a computing or ICT system generally may go through five stages which have been coined here, into modules. The paradigm behind the development of the five modules is as follows:

- Understanding what a computing environment looks like and how it works
- Identifying what it can be used for and how its existence affects the user and the environment

- Building the computing environment and configuring it to solve various problems
- Linking or interconnecting multiple computing environments for the purpose of sharing resources
- Solving real life problems using the already built computer

A successful navigation through the five modules adequately prepares the learner to demonstrate competencies in solving most real life situations that can be handled with the use of ICTs. Thus, the first three (03) modules are taught in Lower Sixth and the last two (02) in Upper Sixth.

Module 1: Computing Environment and Components (76 Hours)

This module introduces learners to what a computing environment looks like, and prepares them to demonstrate competency in identifying, selecting and installing preferable hardware and software components of a computer system, while implementing solutions to problems encountered in the course of working with them.

Competencies here are demonstrated in the following real life situations:

- Monitoring the evolution of computers over time and progressive advantages(revision)
- Description of a computer architecture
- Choosing a computer based on task to be performed
- Configuration of the computer system to process tasks for itself and for the user
- Configuring OS for various tasks
- Using language translators
- Configuration of working environment for different categories of users
- Troubleshooting, maintaining hardware/software
- Managing files and storing information using appropriate file formats
- Setting up the working environment such as to reduce/avoid health related hazards.
- Choosing category of computers for use, based on the quality of their products and services

Module 2: Impacting society with digital technology (80 Hours)

This module leads the learner into finding out the positive and negative changes the use of computers have brought or will bring into society, while proposing instruments for promoting its positive use and preventing negative use. It also looks at how computers and IS can be used to solve daily problems that need IT solutions. Learners here are prepared to demonstrate competency in using some common IS, identifying and proposing digital solutions to a variety of real life problems, and also to cause positive change in society through the use of ICTs while preventing negative change.

Competencies here are demonstrated in the following real life situations:

- Using information systems in an organization
- Proposing digital solutions to variety of real life problems
- Creating awareness of the social, legal, ethical and economic implications of using computers
- Discouraging the negative use of computers, while upholding positive use.
- Prevention of malware and their impact.
- Exploring and working with artificial intelligence
- Using simulation systems
- Discovering multimodal systems

- Using multimedia authoring tools
- Using virtual reality for education and entertainment
- Using Augmented reality for improved visual display, education, entertainment

Module 3: Building ICT systems (116 Hours)

This module introduces learners into how some hardware and software components of an IS are built, and enables them to demonstrate competency in designing IS, writing programs to solve some common problems, coupling of electronic circuits and implementation of these systems.

Competencies here are demonstrated in the following real life situations:

- Building information systems using standard models
- Modeling data in an IS
- Testing a developed information system
- Making choices on which storage device to use based on their capacity.
- Choosing processors based on their speed
- Analysis with digital arithmetic
- Initiation to digital circuits
- Choosing appropriate data types for representation and organization of information
- Designing software
- Selecting and working with programming paradigms
- Implementing programming language components
- Ensuring the built program works as expected
- Organized planning, running and evaluation of a project

The modules are further broken down into three main headings and eight sub-headings as follows:

- I. **CONTEXTUALISATION:** This gives a global picture of the life situation from which lesson inspirations are drawn. This is further broken down into:
 - A) **Family of Real life situation:** This presents an umbrella statement that groups related real life situations
 - B) **Examples of Real life situations:** This column better situates the lesson by bringing practical examples of life situations

- II. **COMPETENCES TO BE ATTAINED:** Competences refer to the ability to do something successfully and efficiently. The competences to be attained here refer to the abilities the learner is expected to build in the course of the lesson. This is subdivided into:
 - A) **Categories of Actions:** These group the examples of related actions learners are expected to be able to carry out in the course of the lesson.
 - B) **Examples of Actions:** These refer to the actions or activities the learner is expected to carry out successfully and efficiently as indicators of having built specific abilities in the course of the lesson.

- III. **RESOURCES:** This refers to the necessary tools required to ensure a successful lesson. This is further broken down into:
 - A) **Basic knowledge:** The information and skills acquired, summarized into keywords that can facilitate research.
 - B) **Attitudes:** These are the behavioral changes expected to be employed by the learner during and/or after learning

C) Other Resources: These are material resources and equipment required to facilitate teaching/learning

D) Duration: This is the expected time interval during which teaching/learning is supposed to take place.

The following Table represents a summary of the teaching hours as well as the coefficient of ICT in the Lower Sixth Class.

| CLASS | WEEKLY TEACHING LOAD (PERIODS) | WEEKLY PRACTICAL LOAD (PERIODS) | ANNUAL TEACHING LOAD (PERIODS) | COEFFICIENTS |
|-------------|--------------------------------|---------------------------------|--------------------------------|--------------|
| LOWER SIXTH | 08 | 02 | 272 | 05 |

TEACHING AND LEARNING STRATEGY

Given the broad nature of skills and competencies that are expected to be developed or exhibited with the CBA approach, it becomes sometimes cumbersome and time consuming to bring the whole set of facilities required to ensure the proper execution of this approach, into the classroom setting. In order to curb this shortcoming, the teacher is required to use ICT tools in the teaching process, which will reduce maximize class time and enhance learner apprehension and comprehension. These tools often provide a better way of making abstract concepts real to the learner while arousing learner interest in what is taught, and also causing an internal motivation which will enable the learner explore and exploit his or her skills to the maximum of their interest.

These ICT tools may include projectors, multimedia resources such as video tutorials, applications, online resources, etc.

The teacher is also required to end every lesson or at least a group of lessons with assignments that consist of mini-projects that provide the opportunity for learners to develop their skills in problem solving.

The teacher also should provide opportunity for the learners to give their own opinion or what they think about the lesson that is taught. This could result in the exhibition of new knowledge and skills, which the teacher is then required to encourage the learner in developing such skills into competencies. As already previewed in the CBA, the dispensation of knowledge is learner centered and not teacher centered. Until a learner has acquired or developed skill in some particular area, that area is not considered taught.

Assessment and Evaluation

For this subject, it is recommended that continuous assessment be used and grades, instead of marks, awarded.

The seven-point scale that follows provides a record of the learning skills demonstrated by the learner in every module of the course through independent work, teamwork, organization, work habits, and initiative.

| Remark | Honour Roll | Excellent | Good | Satisfactory | Needs improvement | Failed | Ungraded |
|---------|--------------|-----------|----------|--------------|-------------------|----------|----------|
| % Score | 90 and above | 80 to 89 | 70 to 79 | 60 to 69 | 50 to 59 | 40 to 49 | < 40 |
| Grade | A | B | C | D | E | F | U |
